

Every alphabet cell is bistable - none is reliably broken

Escape = token accuracy ≥ 0.9 . Bars are 95% Wilson intervals. * marks a cell whose distribution is NOT bimodal, where an escape fraction is a threshold artefact and must not be quoted (S5_c5_t1 spreads continuously over 0.245-0.763). Seed is not the unit of replication: bf16 kernels are non-deterministic, and identical seed and config produced 0.9598 and 0.1177.
