

What we claim to save

$p = 0.10$. The oracle allocates 1.300 factors per token against fixed4's 4.000 - a 3.1x reduction in required work. The same network runs take 756 s and 761 s. Unused factors are still computed and multiplied by zero, so no time is saved. Every cost figure in this project is notional until ragged expansion exists.

What we actually measured
